Education

University of Central Florida Expected December 2026
Bachelor of Science in Computer Science, 3.6 GPA *Orlando, FL*

Relevant Coursework: Data Structures & Algorithms, Object Oriented Programming, Computer Logic and Organization, Systems Software, Database Systems

Technical Skills

Languages: Java, Python, TypeScript, JavaScript
Frameworks: Spring Boot, Node.js, Express.js, Angular, React, Next.js
Data: PostgreSQL, MySQL, MongoDB, Supabase
AI: LangGraph, Google ADK
Infrastructure: Git, Docker, Kafka, GitLab CI/CD, Prometheus, Grafana, Splunk

Experience

BNY June 2026 – August 2026
Software Engineering Intern *Lake Mary, FL*

- Modernized a 25-year-old Asset-Backed Securities platform by contributing to a new Spring Boot and Angular replacement application spanning 5+ services, delivering production code across 3 releases on a 10-engineer team.
- Owned a full-stack feature-flag management interface using Angular and Spring Boot, integrating enterprise entitlement controls and enabling 10 engineers to manage 7 application features across 3 environments.
- Implemented and validated 15 production enhancements and defect fixes across dev/test environments, collaborating with business analysts on requirements, integration testing, and QA acceptance.
- Diagnosed and fixed a scheduler defect producing duplicate tasks every night, restoring accurate automated task generation and preventing downstream processing errors.

BNY August 2025 – December 2025
Applied Technology Intern *Orlando, FL*

- Engineered a financial application health analyzer spanning 5 microservices using Docker Swarm and Prometheus, configuring Alertmanager to detect service failures, high latency, and unresponsive containers in real time.
- Built LangGraph remediation workflows that supplied Alertmanager and AppDynamics telemetry to Gemini Flash for incident triage, automatically restarting or recovering failed containers and escalating unresolved incidents to engineers.

Mirai Arcade June 2025 – May 2026
Software Developer *Orlando, FL*

- Built and deployed a tailored 3-service inventory management system in close partnership with arcade owners using Java/Spring Boot, Python/FastAPI, React, and Apache Kafka, replacing an inefficient legacy system and reducing operating costs by 50% while supporting event-driven inventory updates and forecasting for 30+ staff.
- Engineered fault-tolerant Kafka consumers with dead-letter queue handling, preserving failed messages with error metadata for auditing and later replay.
- Developed a Python demand-forecasting and inventory analytics pipeline across 8+ storage location types, automating reporting and eliminating 3+ hours of manual tracking per week.
- Launched Mirai Arcade's eCommerce platform using Shopify Hydrogen/Oxygen, creating a custom storefront that enabled online ordering and expanded sales channels.

Projects

Onyx – Multi-Agent Financial Analysis Platform | *Python, Next.js, Supabase, React, TypeScript* October 2025

- Architected a multi-agent financial advisor with Google ADK, running fraud detection, budget analysis, and cash-flow prediction as parallel agents against a shared transaction data layer.
- Integrated real-time transaction data through the Plaid API and modeled structured financial records in Supabase, providing each agent with a consistent data layer for reasoning and analysis.
